Tips and Tricks . . .

Getting Started - Don't be surprised if your cars stop several times when you first use the track. Moisture in the air causes corrosion on the steel track rails and it takes a few laps of running to clean it off. So just give it a push any time it stops and continue to drive. It will get better each lap and usually after 3 to 5 laps the problem goes away completely. This can happen anytime the track is unused for many days.

Doesn't Line Up? - On very large sets like this it isn't unusual for the track to not line up perfectly. This is usually caused by little gaps between the track pieces that allow movement over large areas when you are laying down the track. To avoid this start laying down track from the center of the longest straightaway. If the track doesn't come together perfectly, connect it anyway and then adjust the track by smoothing out the straights and corners a little bit at each tack segment.

Make it Smaller - All of these tracks can be made smaller very easily. Just find two sides that have parallel straightaways then simply remove straight track on each side. Just make sure the length of the track you're removing is the same on both sides. Make it bigger? Just reverse the process.
